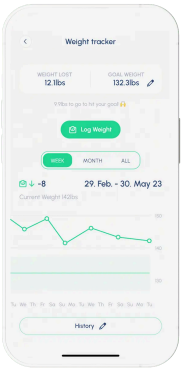
RE019 – Competitive App Research: Fastic

What is Fastic?

Fastic is a health app that helps people do intermittent fasting, which means not eating for certain hours of the day. The app tracks when you're fasting and when you can eat, and also gives food and health tips to support your fasting. A lot of people use it to lose weight, boost energy, or just eat better.

It's not just a timer, it also teaches you what happens to your body at each stage of the fast. It gives tips like drinking more water, eating balanced meals, and avoiding sugar or junk food when you break a fast.



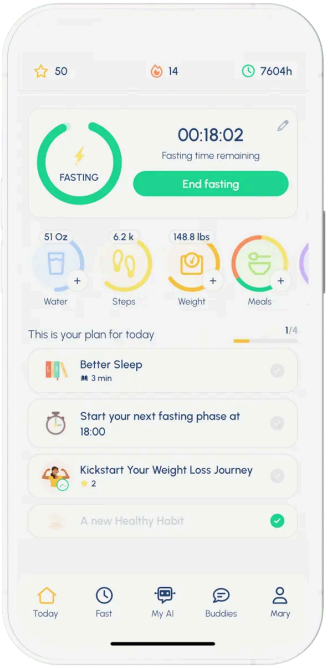
This app is popular with people who want to be more mindful of what and when they eat. It focuses on time-based health, which is different from apps that just track calories or scan food.

How Fastic Combines Time and Nutrition

Fastic connects your fasting times with food tips so it all works together. When you're fasting, it reminds you to drink water, keep moving, and stay on track with little messages.

Once your eating window starts, it gives suggestions on what to eat, like adding more protein, veggies, and cutting down on processed or sugary stuff. It also explains what's happening in your body during each stage of the fast, like when it starts burning fat or cleaning out old cells (that's called autophagy).

It even shows what foods are best to support those stages. So it's not just tracking time, it also helps you eat better based on where you're at in your fast.



So it's not just about *when* to eat, but also *what* to eat, and why it matters.

Reminders and Warnings in Fastic

Fastic includes a range of reminders to help users stay on track with their fasting routine. It sends alerts when it's time to start or stop a fast, which makes it easier to follow the schedule without having to keep checking the timer manually. It also sends hydration reminders, which is helpful during fasting hours when staying hydrated is important.

Also, the app encourages daily habits like walking, checking your mood, or getting enough sleep. These are built into the app to support general health while fasting. Fastic also has the ability to pick up on patterns, for example, if someone regularly ends their fast early or skips days, it adjusts goals or offers suggestions to improve consistency.

However, Fastic doesn't give any warnings related to outside factors. It doesn't alert users about things like allergy season, ingredient risks, or if they're in a new location where food labels might be different. Its focus stays mostly on time based tracking and building good habits, rather than safety or environmental changes.

How Food Remedy Could Use Time-Based Alerts

Food Remedy could definitely improve by including time based or context aware alerts. Right now, the app mainly focuses on scanning ingredients and checking for things like allergens or additives. That's useful, but adding alerts based on timing or real world conditions could make the app even more helpful and personal.

For example, during high pollen or allergy seasons, the app could remind users to avoid certain food triggers that might make their symptoms worse. If someone is travelling and scans something in a new country or region, the app could suggest rechecking the product, since ingredient names or safety standards might be different there.

It could also send a quick reminder if a product was scanned a long time ago, just in case the item has expired or isn't safe to eat anymore. Another useful feature could be linking to fasting routines. If a user is fasting, the app could recommend light or healthy foods when it's time to eat again.

Adding features like these would make Food Remedy more than just a scanner. It would become a smarter tool that adapts to the user's timing, habits, and environment, similar to how Fastic supports users throughout their fasting schedule.

Table: Fastic App Functionalities and Features

Functionality	Description
Fasting Timer	Tracks fasting and eating windows with visual progress.
Nutrition Tips	Provides healthy eating advice linked to fasting stages.
Reminders	Custom alerts for fasting start/end, hydration, and habits.
Pattern Awareness	Detects fasting behavior trends and adjusts goals.
Educational Content	Explains benefits of fasting stages like fat-burning and autophagy.
Habit Tracker	Encourages water intake, step goals, and other wellness habits.
No External Risk Warnings	Does not include food safety or environmental alerts.
