Student ID : 225678253

Ticket No. : RE002

RE002 – Alpha Testing Completion Audit 2

Summary

I carried out an independent review of the testing already available in the Food Remedy repository and then used the application as a regular user to see how well it performed in practice. The main aim was to understand what had already been tested, identify any technical or usability problems, and decide whether the application was suitable to move into closed beta testing.

The repository included automated tests for areas such as product data structure, dataset quality, category handling, missing values, nutrition scoring, conflict resolution, data correction, and product contract checks. One test file could not be included because the required dataset was missing. After excluding that file, the rest of the Python test suite ran successfully, with 95 tests passing and one test skipped.

The DB012 cart integration test also completed successfully. However, the DB030 integration test and the complete DB030 flow could not be verified because scanPipeline.js contained an unexpected end-of-file syntax error.

I also tested the mobile application manually. The main user flows, including onboarding, login validation, navigation, scan history, and product details, were working. At the same time, I noticed some data consistency issues. For example, several nutrient summaries were shown as “Unknown” even though the detailed nutrition table contained actual values.

Based on the overall findings, the application is considered ready for closed beta with conditions. The main user experience is functional, but the DB030 integration error, the missing test dataset, and the nutrient information inconsistencies should be corrected and tested again.

Audit Objective

The objectives of this audit were to:

- Review the testing already available in the repository.
- Run the existing automated tests.
- Identify missing test dependencies or incomplete testing evidence.
- Launch and use the application as a normal user.
- Test the main mobile user flows.
- Record bugs, risks and data inconsistencies.

- Provide a recommendation about closed beta readiness.

This review was completed independently as the second alpha-testing audit.

Testing Environment

Operating system : Windows

Python : 3.14.6

Pytest : 9.1.1

Node.js : 20.19.4

Mobile Framework : Expo/React Native

Mobile Testing : Expo Go on iPhone

Browser Testing : Google Chrome

Manual Mobile Test Results :

Test ID	Feature	Test Performed	Result
MT-01	Onboarding	Opened app and viewed landing screen	Pass
MT-02	Onboarding	Checked Get started button visibility	Pass – Navigated to next screen
MT-03	Login	Tried login with empty fields	Pass – validation message displayed
MT-04	Login	Tried login with invalid credentials	Pass – error message displayed
MT-05	Login	Tried with valid credentials	Pass – logged into the app
MT-06	Profile creation and preference selection	Created the profile and selected the preferences	Pass
MT-07	Navigation	Bottom navigation bar visible and usable	Pass with issue (buttons working but taking time to respond)
MT-07	Product details	Scanned the products and information should load	Pass with issue
MT-08	History	Opened history screen and viewed scanned items	Pass

MT-09	Product details	Viewed nutrient table and tabs	Pass
MT-10	Product details	Nutrition Summary	Fail – Some values undisplayed
MT-11	History Data	Every item should have clear product name	Fail – Item appeared incomplete
MT-12	Shopping List	Checkout option should be available	Pass

Bugs and Issues identified

RE002-BUG-01 – Nutrition Summary does not match available data

Feature : Product details and nutrient summary

Severity : Medium

Expected result : The summary should use the available nutrient values to classify sugar, fat and saturated fat.

Actual result : The summary displays “Unknown” for several nutrients even though it has detailed table which contains values of fat, sugars etc.

Impact : Users may receive inconsistent and confusing guidance

RE002-BUG-02 – Incomplete nutrient classification

Feature : Product details

Severity : Medium

Expected result : Nutrients with available values should have a consistent classification.

Actual result : Some nutrients remain marked as “Unknown” while other are classified as low, moderate or high.

Impact : The application may not be processing all available nutrient information.

RE002-BUG-03 – Product title missing or unclear in history

Feature : Scan history

Severity : Low

Expected result : Each card should clearly show both the product name and brand.

Actual result : One card appears to show only “Sanitarium”, without a clear product title.

Impact : Users may not be able to identify the previously scanned product.

RE002-BUG-04 – Missing preferences

Feature : Product scan

Severity : High

Expected result : Product which has intolerance preference for the user should be shown after the scan.

Actual result : The application is not showing any such warning to the user.

Impact : The application is not processing all the dietary information which might harm the user.

Testing Gaps

The following areas were not fully verified:

- The complete DB030 integration flow
- The full Python suite including test_products.py
- Behaviour of every possible barcode
- Offline operation
- Performance under high load
- Security and privacy testing
- Multiple device sizes
- Android-specific behaviour
- Full allergen accuracy across the complete product dataset
- Consistency of recommendation results for all user profiles
- Direct comparison with RE001

Conclusion

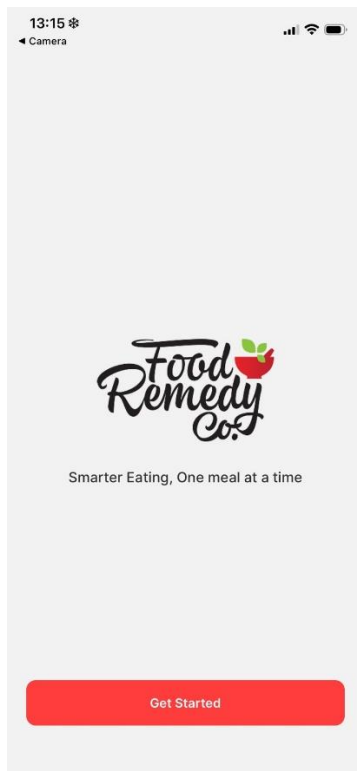

The Food Remedy app is currently usable in its main areas. Most of the Python tests passed, the cart integration worked, and I was able to open and test the key mobile screens without major problems.

At the same time, the audit highlighted a few issues that still need attention. One test could not run because the required dataset was missing, and the DB030 integration test was blocked by a JavaScript syntax error. I also noticed that some nutrition summaries did not match the detailed nutrient values shown on the product page.

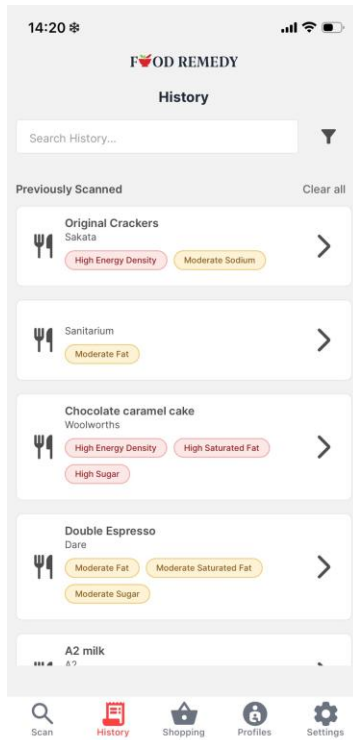

Overall, the app looks suitable for a small closed beta, but the team should fix these technical and data-related issues and run the affected tests again before treating the system as fully ready.
