

RE004 – Food Remedy Closed Beta Feedback Survey

Summary

This report describes the design and development of the Food Remedy Closed Beta Feedback Survey. The survey was created to collect structured feedback from Food Remedy team members participating in the closed beta. It evaluates application usability, feature usefulness, recommendation quality, software bugs, functional issues, and overall user satisfaction. The survey also collects device information, operating system version, and application version to assist with issue tracking. After testing for clarity and completion time, the survey was published using Microsoft Forms and prepared for distribution to the closed beta participants.

Introduction

The Food Remedy application is currently undergoing closed beta testing before wider deployment. During this phase, collecting structured feedback is essential for identifying usability issues, software defects, feature improvements, and recommendation quality. A feedback survey provides an efficient method for gathering consistent responses from testers and helps prioritize improvements before the public release.

Review of Current Research

Previous Food Remedy research identified several important areas that should be evaluated during beta testing. These included personalized recommendations, barcode scanning, product information, nutrition guidance, shopping workflow, application usability, performance, accessibility, and user privacy. These research findings were used to determine which questions should be included in the survey to ensure that feedback focuses on the most important areas of the application.

Survey Design

The survey was designed using Microsoft Forms. Questions were organized into logical sections to improve usability and minimize completion time.

The survey includes:

- Device information
- Operating system version
- Application version

- Login and navigation experience
- Feature usefulness
- Recommendation quality
- Functional issues
- Bug reporting
- Performance evaluation
- Overall user satisfaction
- Open-ended improvement suggestions

The combination of rating-scale questions, multiple-choice questions, and open-ended responses enables both quantitative and qualitative feedback to be collected.

Survey Testing

Before publication, the survey was tested to verify that all questions were clear, easy to understand, and functioned correctly. Required questions were checked to ensure responses could not be accidentally omitted. The survey was completed as a trial to confirm that the estimated completion time was approximately **3–5 minutes**, making it suitable for closed beta participants.

Survey Publication

The completed survey was published using Microsoft Forms and made available for the Food Remedy closed beta testing team.

Conclusion

The Food Remedy Closed Beta Feedback Survey provides a structured method for collecting valuable feedback before the public release of the application. The survey evaluates usability, functionality, recommendation quality, software bugs, and user satisfaction while also collecting device information to assist with troubleshooting. The feedback collected will help the development team identify priorities for future improvements and support the successful deployment of the Food Remedy application.
