

Project: Food Remedy API

Ticket: RE-005 – Review of T1 Deployment Research for Current Development Stage

Author: Gurkirat Singh Chahal

Student ID: 223936693

Date: 30 July 2026

Table of Contents

1. Introduction
2. Review of Previous T1 Deployment Research
3. Comparison with Current Development Stage
4. Review of Platform, Privacy and Regulatory Requirements
5. Classification of Previous Findings
6. Highest-Priority Deployment Actions
7. Conclusion
8. References

1. Introduction

This paper examines the deployment-related research that was finished in Trimester 1 and assesses its applicability to the Food Remedy API project's current development stage. Testing, application deployment, app store preparation, privacy, security, performance, and monitoring are the main topics of the assessment. The objective is to identify areas that need updates, ascertain which findings are still relevant, and suggest the next deployment priority.

2. Previous Deployment Research Completed in T1

The prior trimester was devoted to conducting research in a number of crucial areas in order to get the application ready for deployment.

Previous Research	Purpose
Testing Methodologies	Ensure application reliability before deployment
Privacy & Security Research	Protect user information and comply with regulations
Performance Optimization Research	Improve application efficiency before release
Monitoring & Analytics Research	Monitor application health after deployment
Deployment Readiness Research	Prepare the application for production deployment

These results offered a solid basis for organizing deployment operations.

3. Comparison with Current Development Stage

At this point, the Food Remedy API has advanced past the preliminary research phase. The earlier deployment suggestions are still applicable as development progresses, but they need to be implemented with more focus.

Area	Current Status	Recommendation
Testing	Still highly relevant	Continue functional and integration testing before deployment.

Security	Relevant	Verify authentication and API security.
Privacy	Relevant	Review privacy documentation and user consent processes.
Performance	Relevant	Test response times and optimise API performance.
Monitoring	Requires implementation	Prepare analytics and monitoring before production release.

The current development stage is still supported by the majority of Trimester 1's recommendations.

4. Review of Platform, Privacy and Regulatory Requirements

The deployment criteria that were determined during Trimester 1 are still mostly the same as they are today.

Platform Requirements

- Adherence to the rules of the Apple App Store and Google Play.
- Stability of the application prior to its public release.
- Permissions and application descriptions should be clear.

Privacy Requirements

- Prior to gathering personal data, users must give their consent.
- Data usage is explained in the privacy policy.
- Safekeeping of private data.

Security Requirements

- HTTPS communication.
- Secure authentication.
- Protection against unauthorized access.

During this evaluation, no noteworthy modifications impacting the Food Remedy API deployment strategy were found.

5. Classification of Previous Findings

Previous Deployment Research	Current Status	Build Upon This Trimester	Reason
------------------------------	----------------	---------------------------	--------

Testing Methodologies Research	Current	Yes	Testing remains essential before production deployment.
Deployment Readiness Research	Current	Yes	Current development is progressing towards deployment.
Monitoring & Analytics Research	Requires Further Work	Yes	Monitoring tools still require implementation.
Privacy & Security Research	Current	Yes	Security and compliance remain ongoing priorities.
Performance Optimisation Research	Current	Yes	Performance testing is still required before release.
App Store Preparation Research	Incomplete	Later	Final publishing activities will occur closer to release.

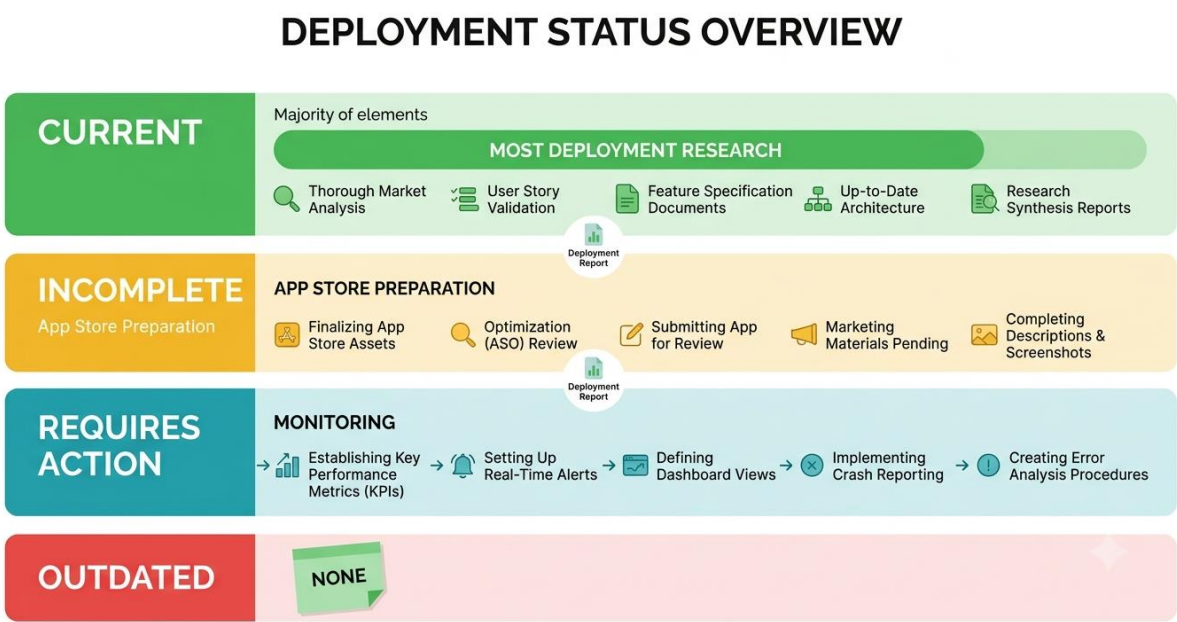

Figure 3: Classification of Previous Deployment Research for Trimester 2

The deployment study from Trimester 1 that is still pertinent and ought to assist the Food Remedy API in the present trimester is identified by this classification.

6. Highest-Priority Deployment Actions

The following are the top priorities based on this review:

- Finish thorough performance, integration, and functional testing.
- Check the authentication and security of the API.
- Examine user consent procedures and privacy paperwork.
- Prior to launch, get analytics and monitoring tools ready.
- As work moves along, keep verifying deployment requirements.
- Complete the application's preparation before sending it to production settings.

By taking these steps, deployment readiness will be enhanced and post-release problems will be minimized.

7. Conclusion

The Food Remedy API project's current phase still greatly benefits from the deployment research finished in Trimester 1. Testing, privacy, security, and deployment planning are still supported by the majority of findings. This trimester's primary goal is to put these suggestions into practice, with an emphasis on monitoring, performance optimization, and final deployment preparation. Expanding on earlier studies guarantees a more seamless deployment procedure and facilitates the application's successful release.
