RE017- Product Details Page (PDP) Research – Food & Nutrition Apps

Prepared For: Food Remedy API – Research Team

Author: Sehajpreet Singh

Date: March 2026 (T1 2026)

Table of Contents

1. Overall PDP layout patterns: -	1
2. Comparison by app: -	2
3. Placement of product info, nutrition data, and actions: -	5
4. Ingredients and allergens : -	6
5. How key health information is highlighted.....	6
6. strengths and weaknesses across the different apps: -	7
7. conclusion: -	7
8. References: -.....	7

1. Overall PDP layout patterns: -

The product page on apps like Yuka, MyFitnessPal, FatSecret, and OneLabel usually follows the same basic pattern:

Top area

- The name of the product, the brand, the serving size, and sometimes a picture of the product.
- A quick score, calorie count, or macro summary is shown near the top so that people can quickly judge the item.

Middle area

- Information about nutrition, like calories, carbs, fat, and protein.
- This area often has a health score or warning system in scanner-first apps.

Lower area

- Additives, allergens, extra breakdowns, or ingredients.

- Secondary actions, such as alternatives, better matches, report/edit, or add to diary, usually appear lower on the page.

2. Comparison by app: -

Yuka

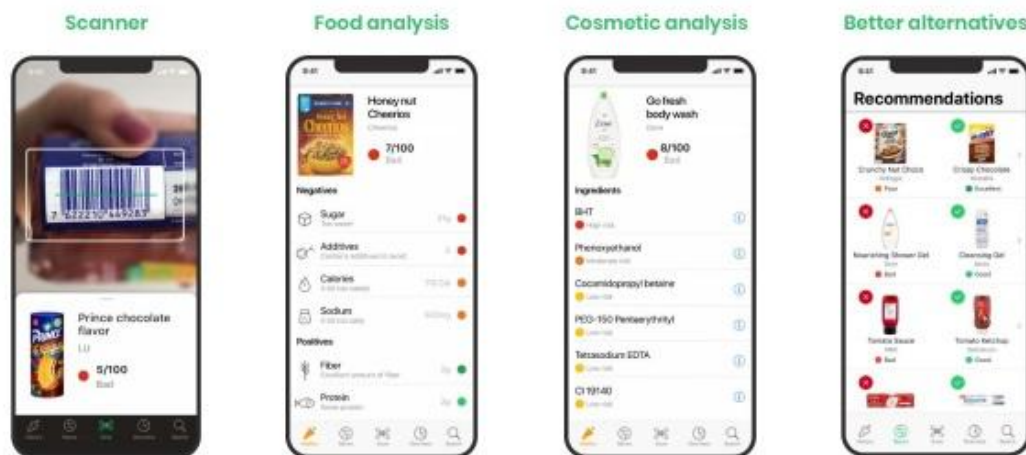

First and foremost, Yuka is designed to quickly judge health. The app store and Google Play descriptions say that it gives a simple color-coded rating like excellent, good, mediocre, or poor. Then, it opens a detailed page that explains the score based on things like nutritional value, additives, and whether or not the food is organic. That means that the health verdict is the most important thing for the PDP, and then it goes into more detail.

Strengths

- Very easy to understand.
- A good way to score things visually.
- Good for quickly figuring out "is this healthy or not?"

Weaknesses

- Not as focused on the detailed logging workflow.
- For people who just want basic nutrition facts, it can feel more like an evaluation than an information source. This is an assumption based on how it was designed to score first.

MyFitnessPal

MyFitnessPal is more about keeping track of things and logging them. Its barcode flow takes users to a page about the food, and support documentation says that page has information about nutrition, controls for serving size, and ways to correct or report problems, like "Not correct?" Find a better fit.

Strengths

- Good for keeping track of what you eat and how much you eat.
- You can see your macros and calories easily.
- The steps to take are clear: add, edit, replace, and report.

Weaknesses

- Health interpretation is not as important as it is in Yuka or OneLabel.
- The sources reviewed do not focus on ingredients and allergen communication.

FatSecret

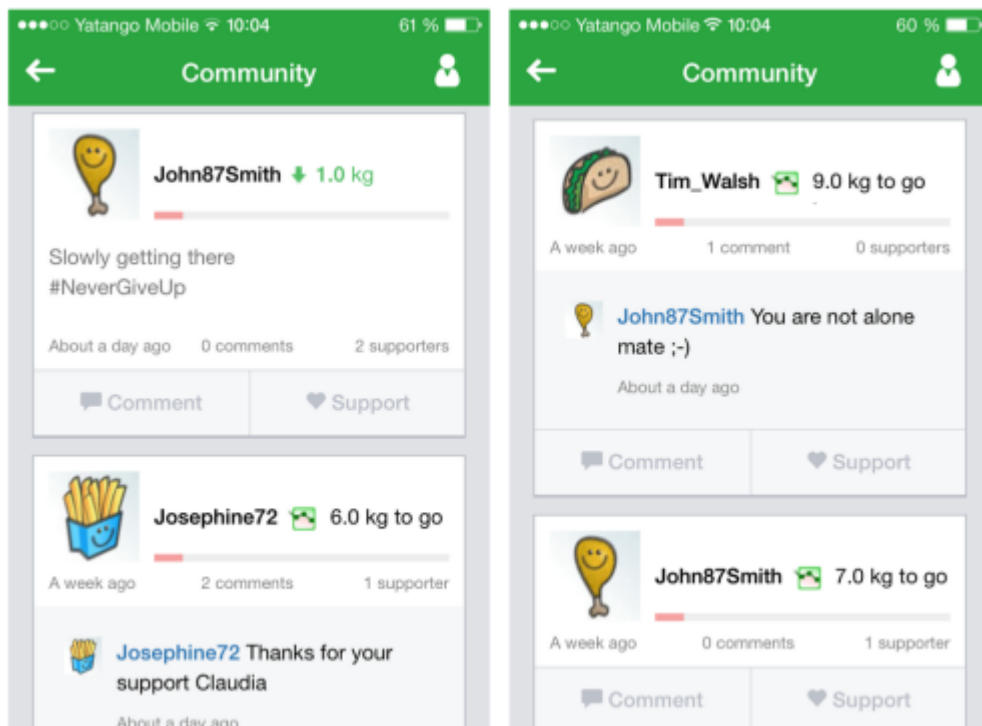

FatSecret is also very focused on tracking, with features like barcode scanning, verified food data, and detailed reports on calories and macros. Its public materials focus on its large, verified food database, barcode scanner, and detailed reporting of calories and macros.

strengths

- Great for keeping a diary and tracking your nutrition.
- A strong database and a workflow for scanning to log.
- Helpful if the goal is to keep track of daily intake instead of checking the risk of ingredients.

Weak points

- Health-risk messages are not as visually strong as Yuka or OneLabel.
- The ingredient/allergen surfacing seems less important in the consumer-facing app experience than it does in the platform/API messaging.

OneLabel

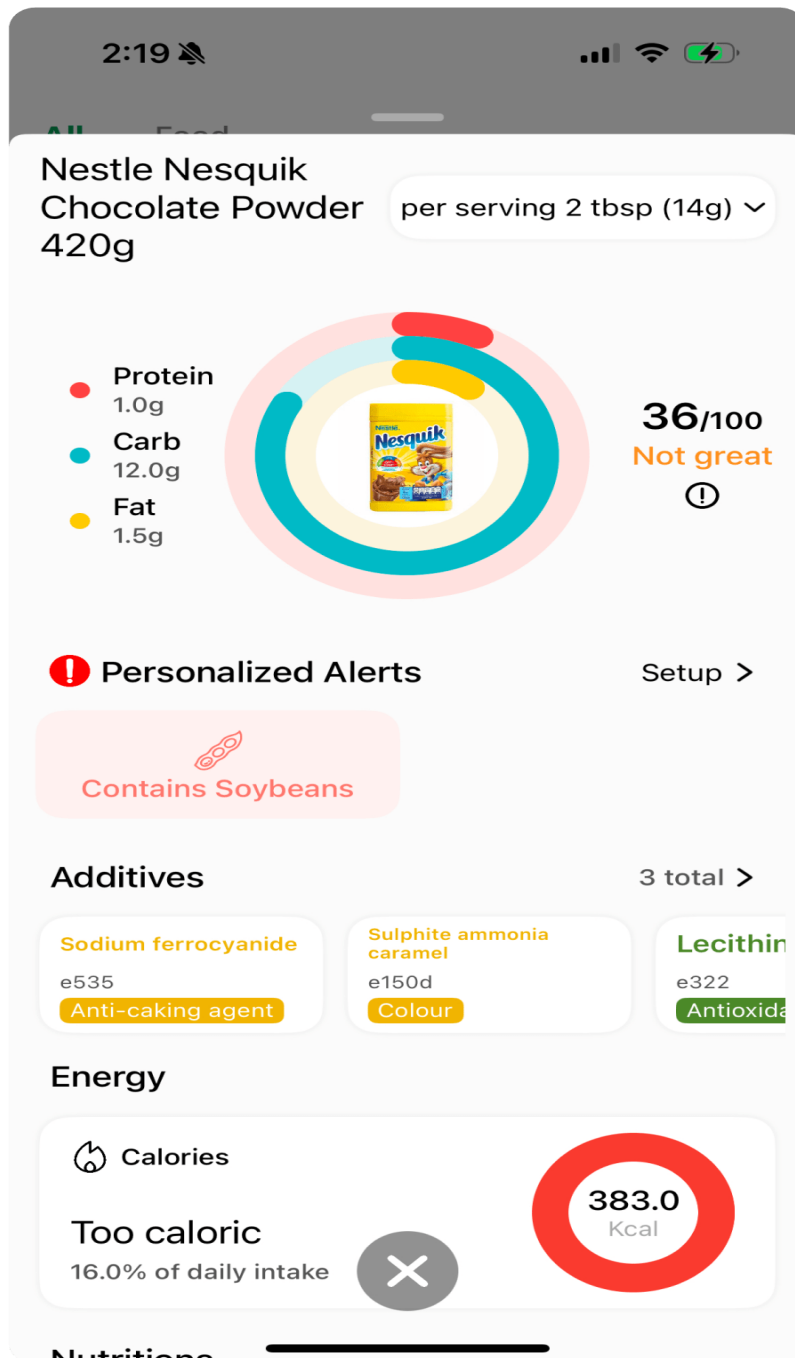

OneLabel is the most clearly set up to show ingredient information and send out risk alerts. The official website says it gives a detailed breakdown based on nutrition, additives, and organic factors. The app listings, on the other hand, focus on finding additives, allergens, controversial ingredients, and possible health risks. Official screenshots also show personalized alerts, allergen chips like "Contains Milk" and "Contains Soybeans," and a score for the whole thing.

Strengths

- Strong visibility of allergens and alerts.
- A strong explanation layer that goes beyond just numbers.
- Helps users make quick "safe / not ideal" shopping choices.

Weaknesses

- Can show a lot of information at once that is useful for judging.
- Might be better for making shopping decisions than keeping a detailed food diary. This is an assumption based on the product's placement and screenshots.

3. Placement of product info, nutrition data, and actions:

-

Product info

Name, picture, serving unit, and brand are usually at the top of all apps.

Nutrition data

- For logging, MyFitnessPal and FatSecret put calories and macros at the top of the list of important information.

- Yuka and OneLabel use nutrition as part of a bigger health check, not just to keep track of it.

Actions

- MyFitnessPal and FatSecret put actions like adding, logging, editing, and searching for better matches at the top of their lists.
- Yuka and OneLabel put understanding, comparing, avoiding, and finding better options at the top of their lists.

4. Ingredients and allergens : -

This is where the apps differ most.

- **OneLabel** makes it very clear what allergens and ingredients are a problem by sending direct alerts and giving scores based on ingredients.
- **Yuka** makes it clear that additives and ingredient analysis are important parts of its score.
- **FatSecret** talks about allergens in its platform/data offering, but the app for consumers is more focused on tracking.
- **MyFitnessPal** is best at keeping track of what you eat; the sources we looked at didn't focus as much on showing ingredients and allergens.

5. How key health information is highlighted

Three main methods appear again and again:

1. Score or color system

- Yuka has a very clear system for grading by color.
- OneLabel uses a number score and messages that warn users.

2. Macro snapshot

- MyFitnessPal and FatSecret focus on calories, protein, fat, carbs, serving sizes, and the context of daily goals.

3. Alerts and explanation

- OneLabel sends out personalized alerts and notices about allergens.
- Yuka tells you why a product got a good or bad score by breaking down its additives and nutrients.

6. strengths and weaknesses across the different apps:

-

App	Main strength	Main weakness
Yuka	Fast health score and easy understanding	Less focused on logging workflow
MyFitnessPal	Best for logging, portions, macros, correction actions	Health-risk and allergen interpretation less prominent
FatSecret	Strong tracking database and scan-to-diary flow	Less emphasis on ingredient-risk storytelling
OneLabel	Best allergen/ingredient alerting and risk explanation	Can feel dense if user only wants basic nutrition info

7. conclusion: -

The analysis shows that nutrition apps' product detail pages have a similar structure, but they are made with different user goals in mind. Apps like MyFitnessPal and FatSecret are all about tracking, so they show calories, macronutrients, and quick actions like adding food to a diary. Apps like Yuka and OneLabel, on the other hand, are more focused on health evaluation. They use scores, color indicators, and ingredient or allergen warnings to help users make quick choices. In general, all of the apps have the same layout, with product details first, then nutrition information, ingredients, and user actions. The main difference is how they show health information. Some apps focus on detailed tracking, while others focus on making it easy to understand quickly.
