RE051 – Competitor Positioning Analysis (App Store Marketing)

Scope & method

I reviewed how leading nutrition & allergen-related apps present themselves **in the Australian Apple App Store** (and cross-checked Google Play where helpful). Focus areas: **taglines (subtitles), first-screen user promises**, and **categories**. Apps: **Yuka, Foodvisor, MyFitnessPal, Spoonful, FoodSwitch**. I then compared these with **Food Remedy** (proposed positioning).

1) App store positioning snapshot (AU)

App	App Store subtitle (headline under name)	First-screen user promise (summary)	iOS category
Yuka	"Find and eat healthy products"	Scan barcodes of food & personal-care items to see health impact; shows ratings and **suggests healthier alternatives**; emphasizes **independence** and **no ads**.	Health & Fitness
Foodvisor	"Diet Tracker for Weight Loss"	Positions as a **personal nutritionist** with **instant food recognition camera**, barcode scanning, personalized nutrition plan, recipes, progress tracking; Apple Health integration.	Health & Fitness
MyFitnessPal	"Macro, Diet & Food Tracker"	"All-in-one" food tracker & health app (nutrition coach, fasting tracker, meal planner, diary); very large food database, community & plans.	Health & Fitness
Spoonful (allergy/FODMAP)	"FODMAPs, Gluten, Vegan & More!"	**Label scanner for special diets**; supports multiple allergies/diets (e.g., Low FODMAP, Gluten-Free); explains ingredient compliance; shopping list & substitutes.	Health & Fitness

FoodSwitch (AU)	"Scan Barcode & Track Nutrition"	**Scan barcodes** to view nutrition info and **get healthier alternatives**; science-based algorithms from **The George Institute**; includes Health Star Ratings/Traffic Lights.	Health & Fitness

2) Similarities & differences vs Food Remedy

Assumption about Food Remedy (current project): a **grocery scanner focused on allergens/additives**, with features like **Allergen Labelling** and **Symptom→Additive mapping**. Positioning below treats Food Remedy as an **allergy-first** scanner.

Dimension	Food Remedy (proposed)	Yuka	Foodvisor	MyFitnessPal	Spoonful	FoodSwitch
Tagline angle	*"Scan & eat safe: allergy & additive checker"* (alt: *"Check allergens, avoid triggers, shop safer"*)	Healthy-products discovery ("Find and eat healthy products")	Weight-loss & diet tracking	All-in-one macro/diet tracking	Multi-diet/allergy discovery ("FODMAPs, Gluten, Vegan & More!")	Nutrition scanning & healthier swaps ("Scan Barcode & Track Nutrition")
Primary user promise	**Instant allergen & additive warnings**, **symptom-to-ingredient insights**, local AU products; private by design	Scan → see health impact; **independent**, **no ads**; alternatives	**Personal nutritionist**: photo recognition, plans, recipes, progress	Track food/macros/fasting + plans & community; huge DB	**Special-diet label scanner**; flags ingredients for many diets; substitutes	**Science-based** scan → nutrition + **healthier alternatives**; HSR/Traffic Lights
iOS category	**Health & Fitness** (recommended to align with peers)	Health & Fitness	Health & Fitness	Health & Fitness	Health & Fitness	Health & Fitness

Allergy focus	**Core** (allergens & additives front and centre)	Medium (additives/ingredients health impact)	Low (general nutrition/weight)	Low (general tracking)	**Core** (FODMAP, gluten, allergens)	Medium (includes GlutenSwitch & nutritional "switches")
Differentiator vs app	**Adds symptom→additive mapping** & targeted alerts	Match "scan + alternatives", but Food Remedy leans **allergy-first**	FR is **scanner-led**, not coaching-led	FR is **nutrition safety**, not macro logging	FR can **unify allergies + additives + symptoms**	FR adds **personal triggers** beyond population nutrition models

3) Patterns in how leaders market themselves

1. **Short, outcome-driven subtitles**

- Health discovery (**Yuka**), **Weight loss** (**Foodvisor**), **Macro/diet tracking** (**MyFitnessPal**), **Diet/allergy coverage** (**Spoonful**), **Scan & track nutrition** (**FoodSwitch**).

2. **First-screen promises keep it simple**

- **Scan & clarity** (Yuka, FoodSwitch), **coach/plan** (Foodvisor, MyFitnessPal), **dietary safety** (Spoonful).

3. **Category choice is consistent**

- All reviewed apps sit in **Health & Fitness** on iOS AU; Play Store also lists them under **Health & Fitness**. This helps discoverability beside fitness & nutrition leaders.
-

4) Recommendations for Food Remedy

Tagline options (pick one style and A/B test):

- **"Scan & eat safe: allergy & additive checker."**
- **"Allergen alerts in one tap—shop with confidence."**
- **"Know your triggers. Scan, check, eat safely."**

First-screen promise (1–2 sentences):

*"Scan any grocery to get instant **allergen & additive warnings**. Food Remedy links your **symptoms to likely ingredients**, suggests **safer alternatives**, and helps you **shop smarter** across Australian products."*

Category:

- iOS: **Health & Fitness** (peer-consistent and signals health/safety value).
- Google Play: **Health & Fitness** (matches positioning used by Yuka/Foodvisor/MyFitnessPal).

Messaging guardrails:

- Lead with **safety & clarity** ("allergen checks, additive flags").
- Secondary: **personalization** ("symptom→additive insights"), **AU data** (if applicable), **privacy** (no ads/independence—if true).
