

TEST012 — Category Harmonisation Testing.

For this testing task, I validated the category harmonisation outputs generated from the Food Remedy cleaning pipeline.

Tests performed:

- Executed the `cleanProductData` pipeline successfully
- Validated `standardCategory` values across the cleaned dataset
- Compared `standardCategory` and `category` fields for consistency
- Verified `searchTags` generation and formatting
- Checked for category mismatches across dataset outputs

Results:

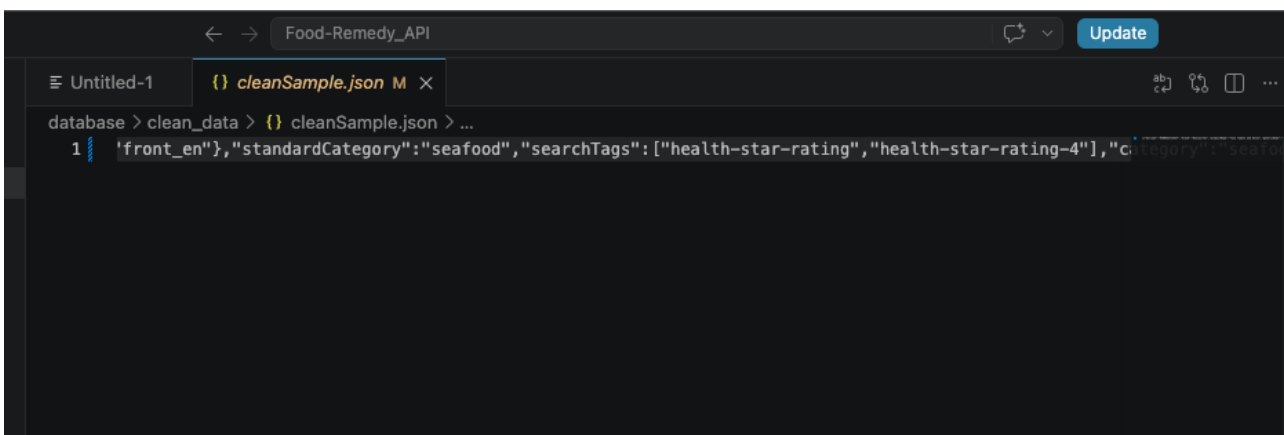

- Cleaning pipeline executed successfully
- `cleanSample.json` was generated correctly
- Categories remained consistent across products
- No mismatches were identified between `standardCategory` and `category`
- `searchTags` were generated correctly for filtering and recommendation support

Evidence:

Terminal execution

```
TypeError: unsupported operand type(s) for |: 'type' and 'NoneType'
(base) yanshuhan@yanshuhandeMacBook-Pro Food-Remedy_API % /opt/miniconda3/bin/python3 -m database.clean_data.cleanProductData
WARNING [93552516]: Barcode must be 13 digits
Cleaned data saved to: database/clean_data/cleanSample.json
Total valid products: 11
(base) yanshuhan@yanshuhandeMacBook-Pro Food-Remedy_API %
```

`cleanSample.json` output screenshots showing harmonised categories and search tags

```
database > clean_data > {} cleanSample.json > ...
1 { "front_en": "", "standardCategory": "seafood", "searchTags": ["health-star-rating", "health-star-rating-4"], "category": "seafood" }
```
