

Report of TEST004 – Profile Integration with Recommendation

Test Environment

- Platform: Web (Expo w mode)
- Date: 20th May, 2026

Test Profiles Created

1. **Profile A:** Soy Allergy + Vegetarian + Weight Loss Goal
2. **Profile B:** Peanuts & Gluten Allergies + Vegan + Heart Health Goal
3. **Profile C (Edge Case):** No Allergies, No Dietary Preferences, No Health Goals (Control)

For Profile 1 – saved values

The screenshot displays a user profile form for 'Maninder Kaur'. At the top, there is a field for the name and an 'Upload Picture' button. Below the name is a date field set to '24'. The form is divided into three sections: 'Select Allergies', 'Select Additives', and 'Select Intolerances'. In the 'Select Allergies' section, 'Soy' and 'Peanuts' are selected. In the 'Select Additives' section, 'Palm Oil' is selected. In the 'Select Intolerances' section, 'Gluten' is selected. The form is scrollable, and a vertical scrollbar is visible on the right side.

Profile 1 (Maninder Kaur) – Soy & Peanuts allergies, Gluten intolerance, Palm Oil additive selected

For Profile 2 – saved values

Profile 2 (Maninder2) – Peanuts allergy, Flavour Enhancers additive, Gluten intolerance selected

For Profile 3 – saved values

Profile 3 (Maninder3) – No allergies, intolerances or dietary preferences (Control)

Testing Checklist

1. Profile Data Persistence – Allergies, Dietary Preferences & Health Goals

- **Action:** Create 3 profiles with distinct configurations, save, navigate away, and reopen to verify persistence
- **Expectation:** All saved values persist correctly after save/reopen/reload
- **Result(s):** Pass
- **Behaviour(s) observed:**

- Profile A (Soy + Vegetarian + Weight Loss): All values saved and persisted correctly
- Profile B (Peanuts & Gluten + Vegan + Heart Health): All values saved and persisted correctly
- Profile C (Edge Case – all empty): Did not break profile screen or navigation flow

Minimum Pass Criteria Met:

- Allergies persist after save/reopen/reload ✓
- Dietary preference persists after save/reopen/reload ✓
- Health goals persist after save/reopen/reload ✓
- Partial/empty profile does not break flow ✓
- Updated profile reflects in warnings/recommendation behaviour ✓

Profile 1 – Dietary Preferences section confirming Vegetarian is saved and persisted (Primary profile)

2. Profile Update Immediately Affects Product Warnings & Recommendations

- **Action:** Update profile information (e.g., change allergy selections) and observe whether product warnings reflect the change immediately
- **Expectation:** Updated profile immediately affects product warnings in tab "For you" and suggestions in tab "Compare"
- **Result(s):** **Pass (partial)**
- **Behaviour(s) observed:**
 - Allergy-based warnings update correctly when profile allergy settings are changed
 - Warning labels update after profile save without requiring app restart
 - Dietary preference changes reflected in search/history tags but not fully in "For you" personalisation tab

Before updating profile

Before – Peanut M&M's "For you" tab showing Allergens: Peanuts, Soy, Gluten → Poor fit 0%, "Contains allergen" warning

Changed profile information

Changed profile – Seafood allergy added; Soy and Peanuts removed from allergy selections

After – result warning changed

After – Same product now shows Good fit 100% and "No conflict found" — warning updated correctly following profile change

3. Recommendation Results Change Correctly When Profile Details Change

- **Action:** Switch between profiles with different configurations and observe recommendation output in tab "Compare"
- **Expectation:** Recommendation results in tab "Compare" reflect the active profile's allergies, dietary preferences, and health goals
- **Result(s):** **Partial Pass**
- **Behaviour(s) observed:**
 - Profile A (no allergies after update): "Good fit" shown; no allergen conflict flagged
 - Profile B (Peanuts & Gluten): Allergen conflict correctly flagged; "Poor fit 0%" shown
 - Profile C (no restrictions): "Good fit 100%" and no conflict — as expected for control profile
- **Remark:** Dietary preference (Vegan / Vegetarian) partially respected but not consistently enforced in recommendation slots

GOALS

None

ALLERGENS

None

Overall product match

Good fit: 100%

This result is calculated using the user demographic profile, health goals, and allergen checks.

Allergen check

No conflict found

No listed allergen conflict was found between your profile and this product.

Add to Shopping List

Profile 1 – Peanut M&M's "For you": Allergens: None → Good fit 100%, No conflict found

Profile 2 – Peanut M&M's "For you": Allergens: Peanuts, Gluten → Poor fit 0%, Contains allergen

Recommendation for Profile 3

Profile 3 (Control) – Peanut M&M's "For you": Allergens: None → Good fit 100%, No conflict found

4. Frontend, Backend & Database Alignment

- **Action:** Verify that profile values set in the frontend are correctly stored and reflected consistently in the recommendation engine
- **Expectation:** Frontend profile screen, backend logic, and database fields are aligned — no mismatch between saved data and personalisation
- **Result(s):** **Pass**
- **Behaviour(s) observed:**
 - Values entered in the profile screen are stored and retrieved correctly on reopen
 - Allergy data saved in profile is read correctly by the recommendation engine for conflict detection
 - No observable mismatch between UI state and recommendation behaviour for allergy fields
- **Remark:** *Dietary preferences appear stored correctly but the recommendation engine does not fully consume them — indicating a partial backend-to-engine integration gap*

Frontend profile screen showing updated allergy state — values confirmed to persist and align with recommendation output shown above

5. Missing or Incomplete Profile Data Handled Safely

- **Action:** Test Profile C (all fields empty) and navigate through product scan, "For you", and "Compare" tabs
- **Expectation:** Missing or incomplete profile data is handled safely without breaking the recommendation flow
- **Result(s):** **Pass**
- **Behaviour(s) observed:**
 - Profile C (empty) loaded without errors
 - "For you" tab shows Good fit 100% and no conflict flags — correct for a profile with no restrictions
 - "Compare" tab shows generic healthier alternatives — no crash or blank screen
 - No null reference errors or broken UI components observed

Other

Select Allergies

- ☐ Egg
- ☐ Soy
- ☐ Garlic
- ☐ Mustard
- ☐ Seafood
- ☐ Tree Nuts
- ☐ Peanuts

Select Additives

- ☐ Artificial Phosphates
- ☐ Flavour Enhancers
- ☐ Food Dye
- ☐ Palm Oil
- ☐ Sweeteners
- ☐ Yeast

Select Intolerances

- ☐ Fructose
- ☐ Gluten
- ☐ Lactose
- ☐ Low FODMAP
- ☐ Sorbitol
- ☐ Sulfonates
- ☐ Caffeine

Profile 3 (Control) – All allergy, intolerance, and dietary preference fields empty; profile saves and loads without error

Profile 3 – Product result: Good fit 100%, no allergen conflict — empty profile handled safely by the recommendation engine

6. Overall Consistency & Integration Summary

- **Overall Profile Integration Effectiveness:** Moderate–Good
- **Key Findings:**
 - Profile data (allergies, dietary preferences, health goals) saves and persists correctly ✓
 - Allergy detection and warning integration works reliably ✓
 - Dietary preference (Vegan / Vegetarian) stored but not fully enforced in recommendations ✗
 - Health goals have limited observable impact on recommendation scoring ✗
 - Empty/incomplete profiles handled gracefully without errors ✓
 - Frontend–backend–database alignment confirmed for allergy fields; partial gap exists for dietary preferences in recommendation engine
- **Suggestions for Improvement:**
 - Strengthen recommendation engine consumption of dietary preferences (Vegan / Vegetarian) to filter out non-compliant alternatives
 - Integrate health goals (e.g., Weight Loss, Heart Health) as active signals in the recommendation scoring logic
 - Add explicit confirmation messaging when profile update has been applied to personalisation
 - Improve "Compare" tab to show profile-aware reasoning for each suggested alternative
