

Project Name : Gopher Industries Food Remedy API

Student Name : M. Jayadhwaj Reddy

Student ID : 225678253

Ticket No. : RE011

The purpose of this assessment is to review the current deployment readiness of the Food Remedy MVP and identify any remaining issues that should be completed before production release. The review considered feedback from the Design, Database and Backend teams, the deployment priorities previously identified in RE005, and the latest technical test results from the current RE011 branch.

Team Feedback Summary

Feedback was collected from the project teams to understand whether any important MVP work was still outstanding.

The Design team confirmed that there were no remaining backlog tickets requiring attention, which suggests that the design work is ready from their side.

The Database team advised that most work from DB001 to DB026 was close to completion. However, several items around DB020 to DB026 were still being finalised, mainly involving fixes, testing and validation. These remaining tasks should be completed before production release.

The Backend team confirmed that one of the main blockers related to missing allergen detection, particularly seafood allergen detection, had been resolved. However, confirmation of any additional backend blockers was still pending at the time of this assessment.

RE005 also identified several important deployment actions, including completing functional, integration and performance testing, verifying authentication and security, reviewing privacy and consent processes, preparing monitoring and analytics, checking deployment requirements and completing final application preparation.

Launch Readiness Checklist

Requirement	Status	Finding	Action before production	Priority
Design readiness	Ready	Design team reported no remaining backlog items	No immediate action	Low
Database readiness	Partially Ready	Several DB020–DB026 tasks still require final fixes, testing or validation	Complete remaining database work	High
Backend readiness	Partially Ready	Allergen detection blocker resolved, further confirmation pending	Confirm all backend blockers are closed	High
Python automated tests	Partially Ready	135 passed, 1 failed, 1 skipped	Resolve remaining pipeline configuration test failure	Medium
Product dataset test	Blocked	Required products_40k_50k.json file is missing	Restore dataset and rerun full test suite	High
DB012 integration	Ready	Integration test passed	No immediate action	Low
DB030 integration	Blocked	Syntax error in scanPipeline.js	Fix syntax error and rerun integration test	High
DB030 full flow	Blocked	Full test stops because DB030 integration fails	Resolve DB030 and rerun end-to-end flow	High
Dependency security	Not Ready	43 vulnerabilities, including 23 high and 5 critical	Review and remediate high/critical vulnerabilities	High
Authentication and security	Needs Verification	Identified as an RE005 deployment requirement	Verify authentication, API security and secret handling	High
Privacy	Partially Ready	Privacy functionality/documentation exists	Complete final privacy and consent review	Medium

Terms of Service	Not Complete	No dedicated Terms screen documented	Finalise Terms of Service	Medium
Monitoring	Partially Ready	Monitoring-related documentation exists	Confirm production monitoring configuration	Medium
Analytics/logging	Needs Verification	Mentioned as future/additional work	Confirm production analytics and logging	Medium
Performance testing	Evidence Available	Performance testing documentation exists	Confirm results apply to current MVP version	Medium
Final deployment preparation	Needs Verification	Identified by RE005 as required	Complete final production/platform checks	High

Final Recommendation

Based on the current evidence, the Food Remedy MVP is **not yet ready for full production deployment**.

The project has made significant progress, particularly with the majority of Python tests passing, successful DB012 integration, completion of the design backlog and resolution of the previously identified allergen detection blocker. However, several important deployment issues remain.

The main areas that should be addressed before production release are the DB030 integration failure, the missing product dataset required for complete automated testing, the remaining Python pipeline test failure, unfinished database validation work and the high and critical dependency vulnerabilities.

The application should therefore remain in pre-production until these high-priority issues have been resolved and the affected tests have been rerun successfully. Once these items are completed and the remaining security, monitoring and deployment requirements are verified, the MVP can be reassessed for production readiness.
