Table of Contents

1. Introduction
2. Team Consultation
3. Summary of Findings
4. Future Research Priorities
5. Conclusion
6. References

1. Introduction

The purpose of this report, which comes after RE-005, is to assess the value of the deployment research finished in Trimester 1 for the ongoing Food Remedy API project. In order to determine which research has been used, which areas need more investigation, and how the Research Team can better support growth during this trimester, feedback was gathered from various project teams.

2. Team Consultation

Team	Team Member	Previous Deployment Research Used	Suggestions for Research Team
Design Team	Design Team Lead	The design team has not directly used the previous deployment research. However, the previous year's handover document and Product Owner expectations have guided the team's work. Previous research may have contributed indirectly.	Continue researching areas that support future implementation and product requirements.
Backend Team	Backend Team Lead	The backend team found the Google Play closed-testing research and deployment checklist to be the most useful resources. These provided a good starting point for understanding the application release process.	Research current Google Play release requirements, Firebase costs and limitations, offline functionality, Firebase privacy and security requirements, and lightweight on-device AI solutions.

3. Summary of Findings

According to the consultation, the earlier deployment research is still useful, especially for the Backend Team. Understanding the release process was made easier by the research on Google Play for closed testing and deployment planning. However, in order to facilitate

implementation and represent current platform requirements, a number of areas currently need new research.

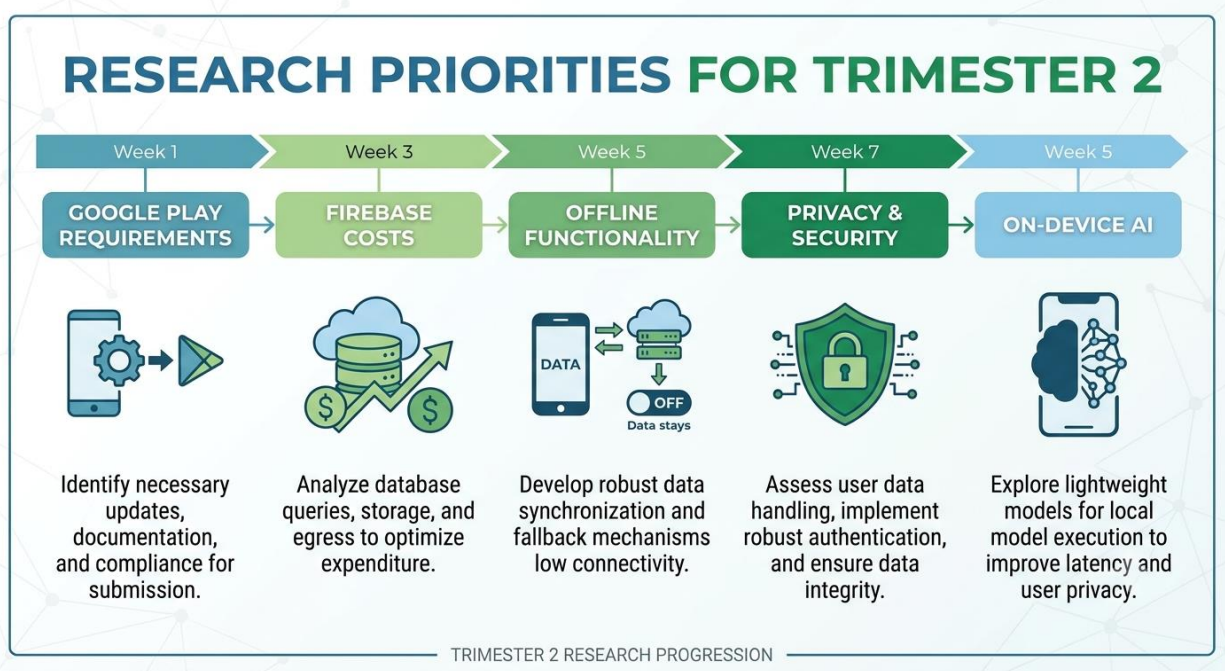

When making design decisions, the Design Team continues to use the prior project handover documentation and Product Owner assistance rather than directly relying on deployment research.

4. Future Research Priorities

Based on the feedback received, the following research topics should be prioritized by the Research Team:

Priority	Research Area	Reason
High	Google Play closed-testing and public release requirements	Required for current application deployment.
High	Firebase and Fire store pricing, quotas and limitations	Important for deployment planning and operational costs.
High	Offline functionality and local processing	May reduce cloud costs and improve application usability.
Medium	Firebase Authentication, Fire store and Storage privacy/security requirements	Supports secure deployment and compliance.
Medium	Lightweight on-device AI/ML solutions	Supports future AI integration within mobile devices.

Figure 2: Research Priorities for Trimester 2

5. Conclusion

The consultation verified that the Food Remedy API project still benefits from earlier deployment studies, especially for the Backend Team. Although deployment planning has previously been supported by some research, fresh research is needed to cover current Google Play needs, Firebase deployment considerations, privacy, security, operational expenses, and offline capabilities. Future Research Team tickets will be guided by these findings, which will also guarantee that research endeavors are in line with the requirements of the development teams.
